Debt spread and inference

Synthetic credit spread

Damodaran ratings table January 2026
Large non-financial company AAA row
Default spread 0.40 percent
Added to the cutoff risk-free rate as a historical proxy.

Original file damodaran_ratings_jan2026.html. This is not a same-day Microsoft bond yield or directly observed lease discount rate.

HC3 calculation method

The regression uses daily MSFT and SPY total-return proxies with an intercept. HC3 scales each squared residual by 1 / (1 - leverage) squared in the covariance sandwich. Beta stays equal to the OLS point estimate. Newey-West lag five is shown separately to check serial dependence.

Method source https://www.statsmodels.org/stable/generated/statsmodels.regression.linear_model.OLSResults.HC3_se.html
Original file hc3_method.html. The delivered Python implements the matrix calculation with NumPy and SciPy.
